Opioid Peptides Biology Chemistry And

This chapter describes the biology and chemistry of the dynorphin peptides. The term dynorphin peptides is used as a collective descriptor for the opioid peptide products specified by the prodynorphin message. Synthetic dynorphin-(1-13) was coupled to thyroglobulin and used to raise antisera in rabbits.

Pharmacochemistry Library, Volume 19: Small Peptides: Chemistry, Biology, and Clinical Studies focuses on the processes, reactions, properties, and characteristics of peptides, including analogues and proteases. The publication first takes a look at angiotensin II and bombesin/gastrin-releasing peptide.

Opioid peptides are peptides that bind to opioid receptors in the brain; opiates and opioids mimic the effect of these peptides. Such peptides may be produced by the body itself, for example endorphins. The effects of these peptides vary, but they all resemble those of opiates.

Other articles where Opioid peptide is discussed: hypothalamus: Hypothalamic regulation of hormone secretion: Well-known examples are the opioids (e.g., enkephalins), so named because they are endogenous (produced in the human body) peptides (short chains of amino acids) with a strong affinity for the receptors that bind opiate drugs, such as morphine and heroin.

Uses in molecular biology. Use of peptides received prominence in molecular biology for several reasons. The first is that peptides allow the creation of peptide antibodies in animals without the need of purifying the protein of interest. This involves synthesizing antigenic peptides of sections of

the protein of interest.
